ECE435: Network Engineering – Homework 6 TCP

Due: Friday, 1 March 2024, 5:00pm

Submission Directions:

For this homework short answers will suffice.

To submit, create a document with your answers (text, pdf, libreoffice, MS Office if you must) and e-mail them to *vincent.weaver@maine.edu* by the homework deadline. Title your e-mail "ECE435 Homework 6" and be sure your name is included in the document.

Notes on tcpdump

For these examples I have been gathering network packet dumps using tcpdump. If you have a Linux machine you can gather similar traces by installing tcpdump and using a command such as: sudo tcpdump -XX -i wlan0 tcp to see the packets going by for TCP connections such as your HW#1 or HW#2 code. You can specify the interface with -i, for example use -i eth0 for wired ethernet.

Questions:

1. Using the code from HW#1 we connect to a server and send this packet. The full packet looks like this:

0x0000:	0013	3b10	667f	b827	ebaf	3711	0800	4500	;.f′7E.
0x0010:	0038	572a	4000	4006	69cc	c0a8	0833	826f	.8W*@.@.i3.0
0x0020:	2e7f	bda5	0050	cdc4	6a49	3c7b	6ca5	8018	PjI<{l
0x0030:	00e5	79£4	0000	0101	080a	0104	3e58	34a8	y>X4.
0x0040:	7bc3	4745	540a						{.GET.

But so far we only know about the parts of the packet starting with the TCP header which begins at offset 0x22:

0x0020:		bda5	0050	cdc4	6a49	3c7b	6ca5	8018	PjI<{l
0x0030:	00e5	79£4	0000	0101	080a	0104	3e58	34a8	y>X4.
0x0040:	7bc3	4745	540a						{.GET.

Fill in the name of the field as well as decode the value. Decode to decimal if it makes sense, report what any flag values are, report units if appropriate. For help decoding the TCP header see the class notes or else RFC793. For the extended options RFC1323 might help too.

BEGIN TCP HEADER			Name of Field	Decoded Value			
0x0022:	bda5						
0x0024:	0050						
0x0026:	cdc4	6a49					
0x002a:	3c7b	6ca5					
0x002e:	80						
0x002f:	18						
0x0030:	00e5						
0x0032:	79f4						
0x0034:	0000						
0x0036:	01						
0x0037:	01						
0x0038:	080a						
0x003a:	0104	3e58					
0x003e:	34a8	7bc3					
END TCP HEADER							
BEGIN DATA							
0x0042:	4745	540a					
	END DATA						

- 2. In the frame from the previous question:
 - (a) What type of server was being connected to (based on the port number)?
 - (b) What percent of the total packet (all bytes received, not just TCP) was useful data? (as opposed to overhead) (also, show your work if you want partial credit)

- 3. You use tcpdump to monitor our sockets program from HW#1. Tcpdump can decode many of the TCP fields for you, the output shown below is the decoded packet summary. Fields like "seq" and "win" are hopefully obvious. In the "Flags" field, S=SYN, P=PSH, F=FIN, etc. Also note tcpdump by default uses "relative SEQ/ACK counts" which means after the initial packet it will print the difference rather than the raw SEQ/ACK values. The first line of each packet summary contains the timestamp, and the source address/port and the destination address/port.
 - (a) You start the server, then connect with the client and you see the following three packets:

```
16:38:55.451412 IP macbook-air.52658 > pi3.31337:
Flags [S], seq 3649305635, win 29200,
options [mss 1460,sackOK,TS val 23595005 ecr 0,nop,wscale 7], length 0
16:38:55.451762 IP pi3.31337 > macbook-air.52658:
Flags [S.], seq 2280757527, ack 3649305636, win 28960,
options [mss 1460,sackOK,TS val 122287507 ecr 23595005,nop,wscale 7], length 0
16:38:55.451829 IP macbook-air.52658 > pi3.31337:
Flags [.], ack 1, win 229,
options [nop,nop,TS val 23595005 ecr 122287507], length 0
```

- i. What just happened? How do you know?
- ii. Why is the initial SEQ number a really large values like 3649305635 instead of starting at 0?
- (b) Your "uppercase" server from HW#1 is running. You type "Hi" on the client and press enter and the following four packets are sent:

```
16:39:01.056250 IP macbook-air.52658 > pi3.31337:
Flags [P.], seq 1:4, ack 1, win 229,
options [nop,nop,TS val 23596406 ecr 122287507], length 3
16:39:01.056551 IP pi3.31337 > macbook-air.52658:
Flags [.], ack 4, win 227,
options [nop,nop,TS val 122288067 ecr 23596406], length 0
16:39:01.057167 IP pi3.31337 > macbook-air.52658:
Flags [P.], seq 1:4, ack 4, win 227,
options [nop,nop,TS val 122288067 ecr 23596406], length 3
16:39:01.057265 IP macbook-air.52658 > pi3.31337:
Flags [.], ack 4, win 229,
options [nop,nop,TS val 23596406 ecr 122288067], length 0
```

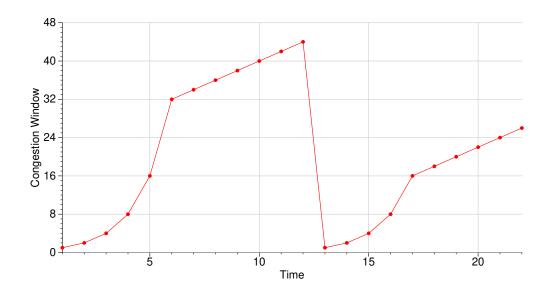

Describe briefly what is going on in each packet.

(c) After typing "bye" and receiving the result BYE you see the following set of packets:

16:39:16.168569 IP macbook-air.52658 > pi3.31337: Flags [F.], seq 18, ack 18, win 229, options [nop,nop,TS val 23600184 ecr 122289578], length 0 16:39:16.168921 IP pi3.31337 > macbook-air.52658: Flags [F.], seq 18, ack 19, win 227, options [nop,nop,TS val 122289578 ecr 23600184], length 0 16:39:16.168974 IP macbook-air.52658 > pi3.31337: Flags [.], ack 19, win 229, options [nop,nop,TS val 23600184 ecr 122289578], length 0

What is going on with these packets?

4. Congestion

When a TCP connection encounters network congestion the behavior of the congestion window might look like the graph above. Once congestion is encountered the congestion window / slow-start threshold gets lowered.

What is one way that the TCP stack running on your machine can determine that packets are being lost over the network in a way that implies congestion?

5. Security

(a) Machine status with ss

You notice your computer is running slowly and the activity LED on your router is blinking rapidly. You are running Linux, and you know that running either netstat or ss -a will tell you at the socket level what's going on.

The ss -a command gives a report similar to the following (the u_str and u_dgm entries are removed; those are UNIX domain sockets which are local-to-the system equivalents of tcp/udp used for interprocess communication).

tcpCLOSE-WAIT 10192.168.8.38:35610216.58.192.194:httpstcpCLOSE-WAIT 10192.168.8.38:36884216.58.192.196:httpstcpESTAB00192.168.8.38:36888130.111.218.16:sshtcpESTAB00192.168.8.38:36888130.111.218.16:sshtcpESTAB00192.168.8.38:36888130.111.218.16:sshtcpESTAB00192.168.8.38:3728423.45.134.221:httpstcpESTAB00192.168.8.38:ssh192.168.8.51:53074tcpSYN-RECV00192.168.8.38:ssh192.168.8.51:53075tcpSYN-RECV00192.168.8.38:ssh192.168.8.51:53076tcpSYN-RECV00192.168.8.38:ssh192.168.8.51:53150tcpSYN-RECV0192.168.8.38:ssh192.168.8.51:53150tcpSYN-RECV0192.168.8.38:ssh192.168.8.51:53150tcpSYN-RECV0192.168.8.38:ssh192.168.8.51:53151tcpSYN-RECV0192.168.8.38:ssh192.168.8.51:53153tcpSYN-RECV0192.168.8.38:ssh192.168.8.51:53153tcpTIME-WAIT0192.168.8.38:5242172.217.9.66:httpstcpTIME-WAIT0192.168.8.38:57386216.58.216.106:httpstcpTIME-WAIT0192.168.8.38:57386216.58.216.106:httpstcpTIME-WAIT0192.168.8.38:57386216.58.216.106:httpsudpUNCONN	Netid	State			Local Address:Port	Peer Address:Port

ii. Should you worry about the sockets in tcp/ESTAB? Why or why not?

iii. Should you worry about the huge number of sockets in tcp/SYN-RECV? Why or why not?

iv. Should you worry about the sockets in tcp/TIME-WAIT? Why or why not?

v. Should you worry about the sockets in udp/UNCONN? Why or why not?

vi. Should you worry about the sockets in tcp/LISTEN? Why or why not?

(b) Using tcpdump you also notice a lot of packets going to a different machine you have, but if you run ss -a it does not show all of those SYN-RECV connections. You view the system log demsg and it says:

[1832748.308978] TCP: request_sock_TCP: Possible SYN flooding on port 22. Sending cookies. Check SNMP counters. [1832752.416011] DCCP: Activated CCID 2 (TCP-like) [1832752.416014] DCCP: Activated CCID 3 (TCP-Friendly Rate Control) [1832752.422698] sctp: Hash tables configured (bind 256/256)

What probably happened here?
