

ECE 435 Final Project (Sample)

Apple II Webserver

Vince Weaver

`http://www.deater.net/weave/vmwprod/apple2_eth/`
`vincent.weaver@maine.edu`

24 April 2026

Background – Webserver for Old Computer

- Apple II hardware, originally from 1977 (this IIe 1987)

Hardware Summary

- 1MHz 6502 processor, 64kB RAM (well, 128kB, it's complicated)
- Uthernet ethernet Card

Software Summary

- BASIC – Beginner's All-purpose Symbolic Instruction Code
- Simple interpreted language, Dartmouth College, 1963
- Apple IIe has Applesoft (Microsoft, blah) BASIC
- Code in plain text, tokenized to more compact format
- Can direct access hardware with PEEK and POKE calls

```
5 REM SAMPLE ECE435 PROGRAM
10 PRINT "ENTER YOUR NAME:":INPUT A$
15 IF A$="ECE435" THEN GOTO 10
20 PRINT "HELLO ";A$;" ";
30 GOTO 20
```

Related Work

- Retro-computing: modern things on old machines
- Other networking solutions: Fujinet, esp32, pi/pico
- Full TCP/IP stack: Contiki, A2osX
- Alternately: dump raw HTTP over serial port, use helper machine to handle Ethernet
- Simple webservers: hard-code/RAM rather than read files from disk
- Unusual to use BASIC

Features

- Serve html, txt, jpg or png files. Also supports favico.ico
- Properly returns 400 and 404 status messages
- RFC 2324 compliant
- Tested to work with Firefox and wget, in theory should work with any browser.

Uthernet Ethernet Card

- Wiznet 5100 ethernet chip
 - standard ethernet card: program with MAC address, it watches for frames with it, copies it to memory, sends an interrupt
 - You can run in this manner, but only so much memory on Apple II, also interrupt support horrible.
 - Would have to program ARP, TCP/IP yourself. This is possible (people have done it) in assembly language

TCP/IP in Hardware

- Chip also supports TCP/IP in hardware
 - You program MAC, IP, and then you get up to 4 sockets
 - Setup IP parameters
 - Handles all of TCP/IP for you.
- You can get interrupt (or poll) when packet comes in and the data is in a circular buffer

Software Setup

- BASIC – common on 1980s micros, interpreted language
- Wrote simple web server in C first, few hundred lines of code
- In BASIC use PEEKs and POKEs to initialize card (MAC address, socket listening on port80)
- Waits for connection, gets HTTP packet
- BASIC parses strings, reads files from disk
- Writes resulting file back out
- Prints debug to screen

Sample Code

```
1200 REM *** LOAD FILE
1202 X$=RIGHT$(N$,3):M$="text/html"
1203 IF X$="txt" THEN M$="text/plain"
1204 IF X$="png" THEN M$="image/png"
1205 IF X$="jpg" THEN M$="image/jpg"
1206 IF X$="ico" THEN M$="image/x-icon"
1207 IF N$="teapot.html" GOTO 9000
1208 ONERR GOTO 8000
1209 PRINT "LOADING ";N$
1210 PRINT CHR$(4)+"BLOAD ";N$
1215 POKE 216,0: REM CANCEL ONERR
1220 FS=PEEK(43616)+256*PEEK(43617): REM FILESIZE
1225 PRINT "DONE LOADING"
```

Network Layer being Used

- Mostly socket programming, so Primarily at the Application / Transport Layer

Security / Ethics Concerns

- Easy to DDOS
- Behind firewall
- Limited utility in getting “root” on an Apple II running BASIC
- Does not track users

Challenges

- BASIC is slow. Memcopying by PEEK/POKE
- https or HTTP/2 not really possible

Future Work

- Use inline assembly routine for PEEK/POKE
- Also try to do minimal ARP and TCP/IP stack
That might require assembly language

Demo/Questions

- Was a featured project on Hack a Day:

<https://hackaday.com/2016/12/17/apple-ii-web-server-written-in-basic/>
